1. Town staff access the GIS portal and they are automatically authenticated with their client credentials.
2. Build a Map, My Groups, and My Content is configured so that the internal user is automatically logged in using IWA. Town staff access the GIS portal and they are logged in right away.
3. Users can access Town GIS web applications and operations dashboards (below)

   I really feel like this is the best use of portal internally.

   Externally, I stood up a second ArcGIS Server that is not federated with the portal. Services can then be accessed in Collector by using ArcGIS Online credentials. At this time, we are keeping our external field collection efforts separate from our ArcGIS Enterprise that is internal. I would call this a hybrid approach.

   I also use this AGS for 3rd party access (Cartegraph, Energov, etc.) to rest services.
